Complete Kit

(Additional wire available for replacement and custom attachments)

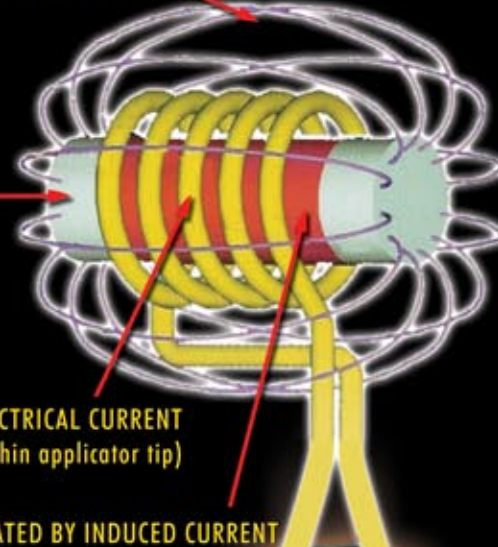

The electromagnetic field induces an electrical current within the work piece that generates heat.

ELECTROMAGNETIC FIELD

WORKPIECE

APPLIED ELECTRICAL CURRENT
(within applicator tip)

HEAT GENERATED BY INDUCED CURRENT

Without the danger of an open flame, you will be able to heat metallic objects near plastic splash shields or other plastic components without the great need to remove or shield them. Saving you the time and inconvenience of unnecessary R&I procedures.

Don't wait till you find that your acetylene torch is empty or that it is across the shop being used.
